It is a process in which a soil sample undergoes a volumetric change due to the application of some type of loading. Placing a load on a soil sample results in a reduction in the void space within the soil. In the laboratory, this load can be applied pneumatically or by simply placing weights on the sample.

Soil Mechanics Lab. Soil is one of the very important engineering materials. Determination of soil conditions is the most significant task in every civil engineering activity. Properties of the soil can be determined by both field and laboratory test methods. It is critical to quantify the various properties of soil in order to predict its behavior under different loading conditions for the safe design of soil structures.

Soil mechanics is a branch of soil physics and applied mechanics that describes the behavior of soils. It differs from fluid mechanics and solid mechanics in the sense that soils consist of a heterogeneous mixture of fluids (usually air and water) and particles (usually clay, silt, sand, and gravel) but soil may also contain organic solids and other matter.
