Modern Attachment Theory is based in three principles which include bonding as an intrinsic human need; regulation of emotion and fear to enhance vitality; and promoting adaptiveness and growth. Common attachment behaviours and emotions, displayed in most social primates including humans, are adaptive. The long-term evolution of these species has involved selection for social behaviors that make individual or group survival more likely.

The construct of "parental alienation" has a controversial history. An attachment-based model of "parental alienation" brings the controversy to an end. An attachment-based model of "parental alienation" uses established constructs and principles of professional psychology to fully describe the psychological and interpersonal processes that create the symptom features of "parental alienation." By defining "parental alienation" within standard and established psychological principles and constructs, an attachment-based model identifies a set of specific diagnostic indicators that can reliably identify "parental alienation" while differentiating "parental alienation" from other sources of parent-child conflict. An attachment-based model for the construct of "parental alienation" also identifies specific domains of professional expertise and knowledge necessary for the professionally competent diagnosis and treatment of this special population of children and families. Children deserve a childhood free from the stress of their parents' conflict, and parents deserve to love and be loved by their children. An attachment-based model of "parental alienation" represents an important step in creating a solution to the family tragedy of "parental alienation" in high-conflict divorce.

Assessing the cause of parent-child conflict following divorce can be a complex undertaking, especially in the context of allegations that one parent is exercising negative parental influence on the child that undermines the child's relationship with the other parent. While securing testimony or conducting an extensive child custody evaluation are ways to assess the possible causes of parent-child conflict and allegations of negative parental influence, a more scientifically-based approach offers an alternative solution. Single-case research designs are an established scientific methodology for determining causality as well as treatment efficacy. A Single-Case Assessment and Remedy protocol offers the Court an empirically based approach for systematically collecting the information on child and family relationships that is needed to address the custody decisions before the Court.

Attachment-based Practice with Adults is an illustrated, multi-media resource offering a theoretically coherent, practice-based model for the application of attachment theory in working with any adults, including those who pose a risk to themselves or to other adults or children. At the heart of the resource is the five-step LEARN model, a flexible interviewing strategy which helps practitioners work with confidence in an attachment-informed way. Having introduced contemporary attachment theory, its links with neuro-biology and the importance of personal stories, the manual and audio DVD provide five powerful case studies to illustrate the three different attachment strategies, with audio interviews, commentaries and guided practical exercises. A detailed Interviewing Guide provides an invaluable framework for conducting and making sense of interviews, with examples of possible responses which might promote integration. Further exercises provide the basis for assessment and intervention with clients, and a final section shows how attachment-informed supervision can help to enhance practice. As a work-based resource, Attachment-based Practice with Adults increases the confidence of practitioners to act as change agents with their clients, and to relate to them in attuned and effective ways. It can be used by individuals, teams, co-workers, supervisors and teachers/trainers to reflect on and improve the preparation, use and support of attachment thinking in practice. It speaks to diverse professions and modalities and can be used in a multidisciplinary environment by both adult and children's services. Author Clark Baim also runs a 10 day course, Attachment-based Practice, spread over 9 - 12 months for all professionals who work with people in distress or who are at risk of harm to themselves or others, of which this training resource accompanies. Professionals within the social care sector are required to undertake Continuous Professional Development (CPD) by the Health and Care Professions Council (HCPC). Those who use this resource will be able to gain CPD points.

Teaching teachers the importance of social connection in the classroom. Human brains are social, and a student's ability to learn is deeply influenced by the quality of his or her attachment to teachers and peers. Secure attachment relationships not only ensure our overall well-being, but also optimize learning by enhancing motivation, regulating anxiety, and triggering neuroplasticity. This book presents a classroom model of secure attachment, exploring how teacher-student rapport is central to creating supportive, "tribal" classrooms and school communities.

In this volume, distinguished therapists and clinicians offer a broad range of effective attachment-based interventions for children with a history of attachment difficulties and complex trauma. Stepping through attachment theory and the latest research in neuroscience, the contributors illustrate how the treatment of developmental trauma often requires implementing more than one clinical model. Including chapters on the practical application of dyadic developmental psychotherapy, mindfulness, theraplay, and EMDR, Attachment Theory in Action offers mental health professionals insights into helping even the most challenging patients.

A practical guide to implementing the rich theory of attachment for treating mental health challenges in children. This book both explains and illustrates how the practice of child mental health professionals can be enhanced, whatever their treatment approach, to encourage engagement, resilience, and development in children with mental health problems. Alongside practical recommendations, Daniel Hughes and Ben Gurney-Smith use dialogue from clinical work to illustrate applications of these principles from Dyadic Developmental Psychotherapy as well as other attachment-based practices with parents and children. This "little book" will demystify how attachment theory—one of today's most in-demand approaches—can actually be brought into clinical work. Topics include regulating emotional states; repairing ongoing relationships; establishing an attachment-based therapeutic relationship; accepting a child's inner life; assessing the caregiver's need for safety, regulation, and reflection; the importance of nonverbal and verbal conversations in facilitating secure attachment; and strengthening the mind of the child.

Introduces the theory of adult attachment as an advanced relationship science that can enable individuals to find and sustain love, offering insight into the roles of genetics and early family life in how people approach relationships.
