Automotive Ethernet stems from proven IT technology and serves the needs for both capacity and integration. Unlike non-automotive Ethernet, the automotive bus uses unshielded, single twisted-pair cabling designed for lower weight and cost. It uses PAM3 modulation to achieve high data rates and reliability.

Automotive Ethernet PHY integrates media dependent interface (MDI) termination resistors into the PHY which simplifies the board layout and reduces board cost by reducing the number of external components. Also, they support an integrated voltage regulator to generate all required voltages so the device can run off a single 3.3V supply.

Automotive Ethernet is capable of symmetric traffic rates, meaning it transports data at the same speed in both directions on a single-pair automotive cable. This capability makes it the preferred technology for the network backbone. However, Ethernet can also operate in an asymmetrical mode when needed.
