Nick Hall is back and taking the story to a new highlight. For me, Douglas Richards is evolving into a more advanced author. The start of the BrainWeb is quite horrific but too realistic to ignore. Combing action and technology was always a strong point of Douglas but this time the main characters are deepening as well.

This is an excellent second installment in the Nick Hall series. The only problem with this series is its improbable assumptions concerning telepathy. Once you set these absurdities aside, these are excellent stories with powerfully driven characters, a strong plot, and many twists and turns to delight the reader and keep him or her guessing.

Nick Hall wakes up in a dumpster, with no memory but the ability to read minds. Oh, and he can access the Internet just using his brain. So a great premise. The first half continued to be pretty good as Nick works out how to handle his new powers and meets a girl with whom he can communicate telepathically.

"Nathan Wexler is a brilliant physicist who thinks he's found a way to send matter a split second back into the past. But before he can confirm his findings, he and his wife-to-be, Jenna Morrison, find themselves in a battle for their very lives. Because while time travel to an instant earlier seems useless, Jenna comes to learn that no capability in history has ever been more profound or far-reaching" -- back cover.

U.S. Secret Service Agent H. Hunter Mahoy has been given a dream assignment by President James Weber. He's training in the military's newest and most sophisticated short-takeoff and vertical landing fighter jet, an F-35-B Lightning. His wife,

Morgan, drops him at Nellis Air Force Base in Las Vegas on the morning of his fifth day. That afternoon, he and the ninety-million-dollar aircraft mysteriously disappear while flying through a slot in a mountain range. The search is on to find a crash site. Locating the wreckage should be easy: Major Brian Connolly, Hunter's flight instructor, witnessed the incident. And it occurred in broad daylight. Even so, nothing can be found. Hunter Mahoy is at a loss to understand why he can't raise Major Connolly-or anyone else-on the radio. Then things get worse. Most of his instrumentation isn't working: he has no navigation system, no GPS coordinates, no radar, no communications, and no digital compass. He recognizes several landmarks but can't find Las Vegas or Nellis Air Force Base. It's weird. He ends up

landing in the desert on the backside of Mount Davidson, outside Virginia City, Nevada. He hikes to where he has a commanding view of the western town. With just one look, he instantly knows that he has a serious problem: somehow, he's traveled back in time to the mining days of the Comstock lode in the mid-to-late 1800s.

The Volume II is entitled “ Neurostimulation and pharmacological approaches ” . This volume describes augmentation approaches, where improvements in brain functions are achieved by modulation of brain circuits with electrical or optical stimulation, or pharmacological agents. Activation of brain circuits with electrical currents is a conventional approach that includes such methods as (i) intracortical microstimulation (ICMS), (ii) transcranial direct current stimulation (tDCS), and (iii) transcranial magnetic stimulation (TMS). tDCS and TMS are often regarded as noninvasive methods. Yet, they may induce long-lasting plastic changes in the brain. This is why some authors consider the term “ noninvasive ” misleading when used to

File Type PDF Brainweb Nick Hall Book 2

describe these and other techniques, such as stimulation with transcranial lasers. The volume further discusses the potential of neurostimulation as a research tool in the studies of perception, cognition and behavior. Additionally, a notion is expressed that brain augmentation with stimulation cannot be described as a net zero sum proposition, where brain resources are reallocated in such a way that gains in one function are balanced by costs elsewhere. In recent years, optogenetic methods have received an increased attention, and several articles in Volume II cover different aspects of this technique. While new optogenetic methods are being developed, the classical electrical stimulation has already been utilized in many clinically relevant applications, like the vestibular implant and tactile neuroprosthesis that

File Type PDF Brainweb Nick Hall Book 2

utilizes ICMS. As a peculiar usage of neurostimulation and pharmacological methods, Volume II includes several articles on augmented memory. Memory prostheses are a popular recent development in the stimulation-based BMIs. For example, in a hippocampal memory prosthesis, memory content is extracted from hippocampal activity using a multiple-input, multiple-output non-linear dynamical model. As to the pharmacological approaches to augmenting memory and cognition, the pros and cons of using nootropic drugs are discussed.

With the probe hidden within the densest rainforest on Earth, traditional military power is useless. So the US chooses to send in a single operative, a man who's been enhanced to the limits of current technology. Use the neuroscience of emotional learning to transform your teaching. How can the latest breakthroughs in the

neuroscience of emotional learning transform the classroom? How can teachers use the principles and practices of positive psychology to ensure optimal 21st-century learning experiences for all children? Patty O'Grady answers those questions. *Positive Psychology in the Elementary School Classroom* presents the basics of positive psychology to educators and provides interactive resources to enrich teachers' proficiency when using positive psychology in the classroom. O'Grady underlines the importance of teaching the whole child: encouraging social awareness and positive relationships, fostering self-motivation, and emphasizing social and emotional learning. Through the use of positive psychology in the classroom, children can learn to be more emotionally aware of their own

and others' feelings, use their strengths to engage academically and socially, pursue meaningful lives, and accomplish their personal goals. The book begins with Martin Seligman's positive psychology principles, and continues into an overview of affective learning, including its philosophical and psychological roots, from finding the "golden mean" of emotional regulation to finding a child's potencies and "golden self." O'Grady connects the core concepts of educational neuroscience to the principles of positive psychology, explaining how feelings permeate the brain, affecting children's thoughts and actions; how insular neurons make us feel empathy and help us learn by observation; and how the frontal cortex is the hall monitor of the brain. The book is full of practical

examples and interactive resources that invite every educator to create a positive psychology classroom, where children can flourish and reach their full potential.
