The automobile and Soviet communism made an odd couple. The quintessential symbol of American economic might and consumerism never achieved iconic status as an engine of Communist progress, in part because it posed an awkward challenge to some basic assumptions of Soviet ideology and practice. In this rich and often witty book, Lewis H. Siegelbaum recounts the life of the Soviet automobile and in the process gives us a fresh perspective on the history and fate of the USSR itself. Based on sources ranging from official state archives to cartoons, car-enthusiast magazines, and popular films, *Cars for Comrades* takes us from the construction of the huge "Soviet Detroits," emblems of the utopian phase of Soviet planning, to present-day Togliatti, where the fate of Russia's last auto plant hangs in the balance. The large role played by American businessmen and engineers in the checkered history of Soviet automobile manufacture is one of the book's surprises, and the author points up the ironic parallels between the Soviet story and the decline of the American Detroit. In the interwar years, automobile clubs, car magazines, and the popularity of rally races were signs of a nascent Soviet car culture, its growth slowed by the policies of the Stalinist state and by Russia's intractable "roadlessness." In the postwar years cars appeared with greater frequency in songs, movies, novels, and in propaganda that promised to do better than car-crazy America. Ultimately, Siegelbaum shows, the automobile epitomized and exacerbated the contradictions between what Soviet communism encouraged and what it provided. To need a car was a mark of support for industrial goals; to want a car for its own sake was

something else entirely. Because Soviet cars were both hard to get and chronically unreliable, and such items as gasoline and spare parts so scarce, owning and maintaining them enmeshed citizens in networks of private, semi-illegal, and ideologically heterodox practices that the state was helpless to combat. Deeply researched and engagingly told, this masterful and entertaining biography of the Soviet automobile provides a new perspective on one of the twentieth century's most iconic—and important—technologies and a novel approach to understanding the history of the Soviet Union itself.

This book comprises high-quality, refereed research papers presented at the 2019 International Symposium on Computer Science, Digital Economy and Intelligent Systems (CSDEIS2019): The symposium, held in Moscow, Russia, on 4 – 6 October 2019, was organized jointly by Moscow State Technical University and the International Research Association of Modern Education and Computer Science. The book discusses the state of the art in areas such as computer science and its technological applications; intelligent systems and intellectual approaches; and digital economics and methodological approaches. It is an excellent reference resource for researchers, undergraduate and graduate students, engineers, and management practitioners interested in computer science and its applications in engineering and management.

Recently, there has been a lot of interest in provably "good" pseudo-random number generators [lo, 4, 14, 31]. These cryptographically secure generators are "good" in the sense that they pass all probabilistic polynomial time statistical tests. However, despite these nice properties, the secure generators known so far suffer from the handicap of being inefficient; the most efficient of these take n^2 steps (one modular multiplication, n being the length of the seed) to generate one bit. Pseudo-random number generators that

are currently used in practice output n bits per multiplication (n^2 steps). An important open problem was to output even two bits on each multiplication in a cryptographically secure way. This problem was stated by Blum, Blum & Shub [3] in the context of their $z^2 \bmod N$ generator. They further ask: how many bits can be output per multiplication, maintaining cryptographic security? In this paper we state a simple condition, the XOR-Condition and show that any generator satisfying this condition can output $\log n$ bits on each multiplication. We show that the XOR-Condition is satisfied by the \log least significant bits of the $z^2 \bmod N$ generator. The security of the $z^2 \bmod N$ generator was based on Quadratic Residu-ity [3]. This generator is an example of a Trapdoor Generator [13], and its trapdoor properties have been used in protocol design. We strengthen the security of this gene- tor by proving it as hard as factoring.

This self-confessed introduction provides technical administrators and managers with a broad, practical overview of the subject and gives researchers working in different areas an appreciation of developments in nanotechnology outside their own fields of expertise.
