In most cases a short half-life time is not effective to deliver sufficient amount of drugs to the target organs and tissues, which is generally caused by fast renal clearance and low plasma stability due to proteolytic degradation during systemic circulation, because that the most common clearance pathway of small proteins and peptides is through glomerular filtration by the kidneys.

~~Optimization of Protein and Peptide Drugs Based on the ...~~

There are some problems which are common in all types of kidney disease with protein in the urine:-High blood pressure - Kidney disease commonly causes high blood pressure. This increases the risk of further kidney disease, and also the risk of heart attack and stroke. Drugs may be needed to control the blood pressure

~~Proteinuria | National Kidney Federation~~

The main function of the kidney is to maintain body homeostasis; regulating blood composition of water, electrolytes, solutes, buffers as well as elimination of several organic compounds such as drugs and exogenous compounds. The kidney consists of different cell types organized into sub-anatomical tissue structures with distinct functions in different segments of the nephron.

~~The human proteome in kidney - The Human Protein Atlas~~

Kidneys damaged by diabetes can start to leak out protein, and this can lead to kidney failure. But interesting new research shows that it might be possible to plug those leaks before they cause too much damage. For people with diabetes, the chances of also developing kidney disease are relatively high. In fact, people with diabetes are five times more likely to need either kidney dialysis ...
