Dynamic Systems & Control is a major technical area within the Walker Department of Mechanical Engineering at The University of Texas at Austin. The Dynamic Systems & Controls area focuses on principles and methods for designing and controlling engineered and natural systems. A broad-based perspective inspires a creative engineering approach to applications involving systems comprised of multiple interacting energetic devices or processes having a wide range of spatial and temporal scales.

Dynamic Systems and Control - Mechanical Engineering

Engineering system dynamics focus on deriving mathematical models based on simplified physical representations of actual systems, such as mechanical, electrical, fluid, or thermal, and on solving the mathematical models. The resulting solution is utilized in design or analysis before producing and testing the actual system.

Mechanics (Greek: ?????????) is the area of physics concerned with the motions of macroscopic objects. Forces applied to objects result in displacements, or changes of an object's position relative to its environment.This branch of physics has its origins in Ancient Greece with the writings of Aristotle and Archimedes (see History of classical mechanics and Timeline of classical mechanics).
