forces behind the dramatic development of computersystem architectures over the past three decades. Even though it is quite clear that this development cannot only be measured by the maximum number of components on a chip, Moore's Law may be and is often taken as a simple measure for the non-braked growth of

computational power over the years. The more components are realizable on a chip, the more innovative and unconventional ideas can be realized by system architects. As a result, research in computer system architectures is more exciting than ever before. This book covers the trends that

shape the field of computer system architectures. The fundamental trade-off in the design of computing systems is between flexibility, performance, power consumption, and chip area. The full exploitation of future silicon capacity requires new architecture approaches and new design paradigms such as

For a successful use in practical applications, it is not enough to solve the hardware problems but also to develop platforms that provide software infrastructure and support

A quantum jump in complexity is achieved by embedded computing systems with an unprecedented level of connectivity linking together a growing number of physical devices through networks.

Embedded systems will become more and more pervasive as the component technologies
