Orthopedic pathology, also known as bone pathology is a subspecialty of surgical pathology which deals with the diagnosis and feature of many bone diseases, specifically studying the cause and effects of disorders of the musculoskeletal system. It uses gross and microscopic findings along with the findings of in vivo radiological studies, and occasionally, specimen radiographs to diagnose diseases of the bones.

An important molecular topic regarding bone pathology is the receptor for nuclear factor- (RANK), which is expressed on macrophages, monocytes, and preosteoclasts. The binding of RANK ligand (RANKL) to RANK stimulates osteoclastogenesis. RANKL is produced by osteoblasts and marrow stromal cells.

Degeneration of the articular cartilage and osteoarthritis are caused most often by wear and aging. A previous injury to the hip joint, bone deformities, or stress from repetitive physical activities may also cause or increase the likelihood of this condition. Other associated risk factors include obesity and a family history of osteoarthritis.

Stage of subperiosteal and endosteal cellular proliferation – The most prominent part of the first stage of fracture healing is cell growth from the deep surface of the periosteum (a dense layer of vascular connective tissue enveloping the bones) These cells are precursors to osteoblasts (a large multinucleate bone cell which absorbs bone tissue during growth and healing). A collar of active tissue encircles the fracture site, bridges of tissue then grow towards each other.

Osteomyelitis, infection of bone tissue. The condition is most commonly caused by the infectious organism Staphylococcus aureus, which reaches the bone via the bloodstream or by extension from a local injury; inflammation follows with destruction of the cancellous (porous) bone and marrow, loss of blood supply, and bone death. Living bone grows around the infected area and walls in the dead tissue, forming an involucrum, the contents of which are gradually resorbed as the lesion is repaired.

The musculoskeletal system provides vital functions such as protection of fragile tissues, support, contribution to mineral homeostasis, and locomotion. In this chapter, we cover toxicologic pathology of importance to the nonpathologist in three major tissues comprising this system: bone and joints, skeletal muscle, and teeth.

Paget's disease of bone disrupts the normal cycle of bone renewal, causing bones to become weakened and possibly deformed. It's a fairly common condition in the UK, particularly in older people. It's rare in people under 50 years of age.

[Paget's disease of bone - NHS](#)

A bone fracture is a medical condition in which there is a partial or complete break in the continuity of the bone. In more severe cases, the bone may be broken into several pieces. A bone fracture may be the result of high force impact or stress, or a minimal trauma injury as a result of certain medical conditions that weaken the bones, such as osteoporosis, osteopenia, bone cancer, or osteogenesis imperfecta, where the fracture is then properly termed a pathologic fracture.
