case-based review book an indispensable tool for success. Duke Radiology Case Review has long been considered one of the standards in board review, and is a well-known adjunct to the popular and well-attended board review course given by the prestigious Department of Radiology at Duke University. Close to 300 case presentations are structured to align with the way residents are taught to work through patient cases. Divided by body region and including chapters on interventional radiology and nuclear medicine, each case offers a clinical history, relevant images, and bulleted points describing the differential diagnosis. This is followed by the actual diagnosis and key clinical and radiologic facts about the diagnosis and suggested readings. This edition includes a new chapter on cardiac imaging.

In 129 cases featuring over 600, high-quality images, Genitourinary Imaging Cases provides a succinct review of clinically relevant cases which cover both benign and malignant conditions of the genitourinary system. Cases are grouped into sections that are organized by body part including: Kidney, Retroperitoneum, Adrenal, Ureter, Bladder, Prostate, Urethra, Vagina, Penis, Testis, Epididymis, and Scrotum, Uterus and Fallopian Tube, and Ovary. Part of the Cases in Radiology series, this book follows the easy-to-use format of question and answer in which the patient history is provided on the first page of the case, and radiologic findings, differential diagnosis, teaching points, next steps in management, and suggestions for furthering reading are revealed on the following page. This casebook is an essential resource for Radiology Residents and practicing Radiologists alike.

A book such as this, correlating radiologic findings with the associated gross and microscopic pathologic findings, has never been offered to the medical community. It contains radiologic images, in a variety of formats (ultrasound, CT scan, MRI scan) correlated with gross photos and photomicrographs of a wide spectrum of pathologic entities, including their variants, occurring in the following organs or anatomic sites. This book would be of particular interest to radiologists and radiologists-in-training, who naturally are very cognizant of radiologic abnormalities, but who rarely, if ever, encounter visual images of the pathologic lesions that they diagnose. It will also be of interest to pathologists and pathologists-in-training, urologists, GU radiation oncologists, and GU medical oncologists.
