by highly skilled and experienced psychiatrists and psychologists who have worked with dreams for at least a decade. The reader can sample radically different approaches from various schools of interpretation and gain the tools for making meaningful comparisons. The contributors describe their theoretical roots and how they have departed from them when confronted with the real world of real dreamers. Each chapter teaches the reader in practical terms what to do when trying to understand a dream of one's own, or one's friend, colleague, or client. Readers are taken behind the curtain of theory into the consultation room where the work of interpretation takes place. This book provides a variety of contemporary, non-dogmatic, practical ways to work with dreams. Each contributor emphasizes not theory, but interpretive method and practical application of dream interpretation. Contributors to this volume include John E. Beebe, Eric Craig, Gayle Delaney, Loma K. Flowers, Ramon Greenberg, Milton Kramer, Joe Natterson, Chester Arthur Pearlman, Montague Ullman, and Stephen J. Walsh.

Epileptic disorders need treatment for many

years or even for life, and this makes a thorough understanding of the pharmacokinetics and possible hazards and side effects of the drugs used in treatment mandatory. During recent decades our knowledge in this field has considerably increased, not least as a result of the development of specific and sensitive methods for the determination of anti epileptic agents in biological material. The clinical pharmacology of this group of drugs has been studied extensively and can today be regarded as well established. This does not necessarily mean that drug treatment of epilepsy is without problems. For example, it has recently been shown that one of the newer anti epileptic drugs, greeted with great enthusiasm by clinicians, may in rare instances induce serious damage to the liver and the pancreas, and seems even to have a certain teratogenic potential. Clinical problems should be understood as a challenge to the experimental pharmacologist, who should try to find explanations for the clinical hazards, and, if possible, show new ways in which better drugs might be developed. In recent years interest has focused on the importance of the inhibitory transmitter  $\gamma$ -aminobutyric acid (GABA) in the pathophysiology of epilepsy, and there have been a series of attempts to find useful antiepileptic drugs among substances interfering with GABA metabolism in the CNS.

This volume in the Handbook of Clinical Neurophysiology series defines the role of clinical neurophysiology in the study of disorders of sleep. It includes the physiology of sleep, and the role of clinical neurophysiology in assessing sleep with common and less common methods of testing. The epidemiology of sleep disorders and the wide range of neurophysiologic abnormalities associated with them are described, including disorders associated with other neurologic diseases. The ultimate reference source for clinical neurophysiologists on disorders of sleep. Volume in a prestigious series published in association with the International Federation of Clinical Neurophysiology. International contributor list drawn from around the world. Discusses physiology, techniques used in clinical neurophysiology, and disorders of sleep.

Revised and updated to include all the latest developments in the advancing field of sleep medicine, this book covers the basic sciences as well as sleep pathology in adults. New coverage on psychiatry, circadian rhythms, cardiovascular diseases, and sleep apnoea treatment and diagnosis.
